

Secure Code-to-Cloud: Key Discovery Questions

Topic 4: AI Powered Infrastructure as Code

Modern development moves fast, but security must keep pace. These questions help identify gaps in governance, tooling, and visibility across your pipelines.

Question List

Use these questions to assess your software supply chain security and DevSecOps readiness.

- 1 How are you provisioning and changing cloud infrastructure today? and how consistent is it across teams?
- 2 Are teams using templates or GenAI tools to speed up IaC creation? and what guardrails exist before changes are applied?
- 3 Do you scan IaC pulls to catch misconfigurations early, and do you block risky changes automatically?
- 4 How do you enforce infrastructure standards (network exposure, encryption, IAM least privilege) and detect drift after deployment?
- 5 How do you manage supply chain risk in your infrastructure automation (third party modules, build tooling, dependencies) and produce audit evidence when asked?

Why These Questions Matter?

Answering these questions helps uncover risks and align your strategy with best practices in DevSecOps.
