

Secure Code-to-Cloud: Key Discovery Questions

Topic 5: The future of Application Security & Gen AI

Modern development moves fast, but security must keep pace. These questions help identify gaps in governance, tooling, and visibility across your pipelines.

Question List

Use these questions to assess your software supply chain security and DevSecOps readiness.

- 1 Are developers using GenAI coding assistants today, and what guardrails exist (secure patterns, review controls, policy)?
- 2 How do you currently find and manage risk across code, open source dependencies, containers, and APIs and is “too many findings” a problem?
- 3 Do you have a single source of truth for artifacts and images, and do you scan + gate what gets pushed into production?
- 4 Are you generating SBOMs today, and can you meet customer or regulatory expectations for provenance and compliance?
- 5 How do you validate real exploitable issues in running apps (DAST) and ensure findings map to owners, with measurable remediation time?

Why These Questions Matter?

Answering these questions helps uncover risks and align your strategy with best practices in DevSecOps.
