

Secure Code-to-Cloud: Key Discovery Questions

Topic 8: Release Management & Feature Flagging

Modern development moves fast, but security must keep pace. These questions help identify gaps in governance, tooling, and visibility across your pipelines.

Question List

Use these questions to assess your software supply chain security and DevSecOps readiness.

- 1 How often do you deploy today, and can the team push to production late on Friday?
- 2 When you launch a new feature, can you start with a small cohort, or is it all or nothing?
- 3 If a feature causes an incident, what does “rollback” look like do you need a redeploy/hotfix, and how long does it take to mitigate?
- 4 Do you have an easy way to turn off specific functionality during traffic spikes or third-party outages? Who is allowed to do that?
- 5 Are you running experiments A/B, canary, phased rollouts?

Why These Questions Matter?

Answering these questions helps uncover risks and align your strategy with best practices in DevSecOps.
